

ENVIRONMENTAL MANAGEMENT

At **GEC**, we are purposeful in our approach to the environment in all stages of client service delivery.

Our aim is to demonstrate best practice in sustainability and to minimise harm to the environment by:

- Engaging with subject matter experts, the community, and clients on environmental considerations to ensure we set high standards and are aware of culturally significant considerations.
- Applying a systematic process to the identification and evaluation of potential environmental risks associated with entire life cycle delivery at the outset – incorporating construction, operation and decommission phases into our planning process.
- Consistently observing all regulatory requirements and demonstrating best practice in how we prevent, control, mitigate and otherwise address potential for environmental risk.
- Tailoring management practices to best suit the environmental conditions and ecosystems we work within.
- Remaining innovative and adaptive, in our approach to decision making and risk management by continuing to proactively drive efficiency in our use of resources.
- Proactively recycling and reducing waste generation as part of a holistic approach to delivery.
- Regularly assessing and reviewing this Environmental Management Policy and associated procedures to ensure objectives are being met for ongoing effectiveness.
- Actively promoting this policy through company education, inductions, and training activities.
- Consideration of health and safety aspects of environmental management for a fully integrated approach.
